The piling works will be nearing completion within Phase 2 adjacent to the Dugald Stewart Building, and will be progressing in Phase 3 near Informatics.

The bulk earthworks excavation works to the basement will be continuing, working from Potterrow Road elevation towards Dugald Stewart. This will see an increase in vehicle movement off and on site as the material is taken to the local landfill. The excavation works might be quite noisy at times as we will have to break out the hard sandstone in some of the areas.

The precast concrete infill panels will be installed in parallel with this operation to form the back face of the basement wall.

Works Happening Next Week
Works ongoing in this period will be pretty similar to that of the previous week, with piling works ongoing in Phase 3, and the continuation of the basement earthworks removal and king post wall panel installation. Piling works including the load testing of the piles should be completed within 3 to 4 weeks thereafter.

We are hoping to undertake some survey works underneath the raised floors in the Informatics building on levels 1, 2 and 3. This is in advance of the planned works which relate to the installation the new underfloor heating and plantroom reconfiguration in these areas.
